

# Azure Site-to-Site VPN

Azure Site-to-Site (S2S) VPN is a networking solution that enables you to connect your on-premises network to an Azure Virtual Network (VNet) over the internet securely. Here's an overview of how Azure S2S VPN works and how to set it up:

## How Azure S2S VPN Works

1. **Gateway Deployment:** You deploy a VPN gateway in Azure and configure it as the endpoint for the VPN connection.
2. **On-Premises VPN Device Configuration:** You configure your on-premises VPN device (e.g., router, firewall) to establish a VPN connection with the Azure VPN gateway.
3. **IPsec Tunnel Establishment:** The VPN devices negotiate an IPsec tunnel, creating a secure encrypted connection between your on-premises network and the Azure VNet.
4. **Routing Configuration:** You configure routing to enable traffic flow between your on-premises network and Azure resources.

## Features of Azure S2S VPN

1. **Secure Communication:** Uses IPsec protocols for encrypted communication.
2. **Scalability:** Supports high-throughput connections to accommodate various workload demands.
3. **Compatibility:** Works with a wide range of VPN devices from various vendors.
4. **Redundancy:** Provides high availability and redundancy options for resilient connections.
5. **Monitoring and Logging:** Offers visibility into VPN connection health and traffic flow.

The end goal is to establish a secure Site-to-Site VPN connection between an on-premises network and an Azure Virtual Network. This enables secure and seamless communication between resources hosted in Azure and the on-premises network, facilitating scenarios like hybrid cloud setups, remote office connectivity, and secure data transfers.

## To begin with the Lab:

1. First, we will create a Virtual Machine that will be part of our previous resource group.
2. Follow the below snapshots to create your VM.

## Project details

Select the subscription to manage deployed resources and costs. Use resource groups like folders to organize and manage all your resources.

Subscription \* ⓘ

Azure Pass - Sponsorship

Resource group \* ⓘ

new-grp

## 3. Then in the networking you need to create a new Virtual network.

Basics Disks **Networking** Management Monitoring Advanced Tags Review + create

Define network connectivity for your virtual machine by configuring network interface card (NIC) settings. You can control ports, inbound and outbound connectivity with security group rules, or place behind an existing load balancing solution.

### Network interface

When creating a virtual machine, a network interface will be created for you.

Virtual network \* ⓘ

(new) Company-VN

[Create new](#)

Subnet \* ⓘ

(new) default (10.2.0.0/24)

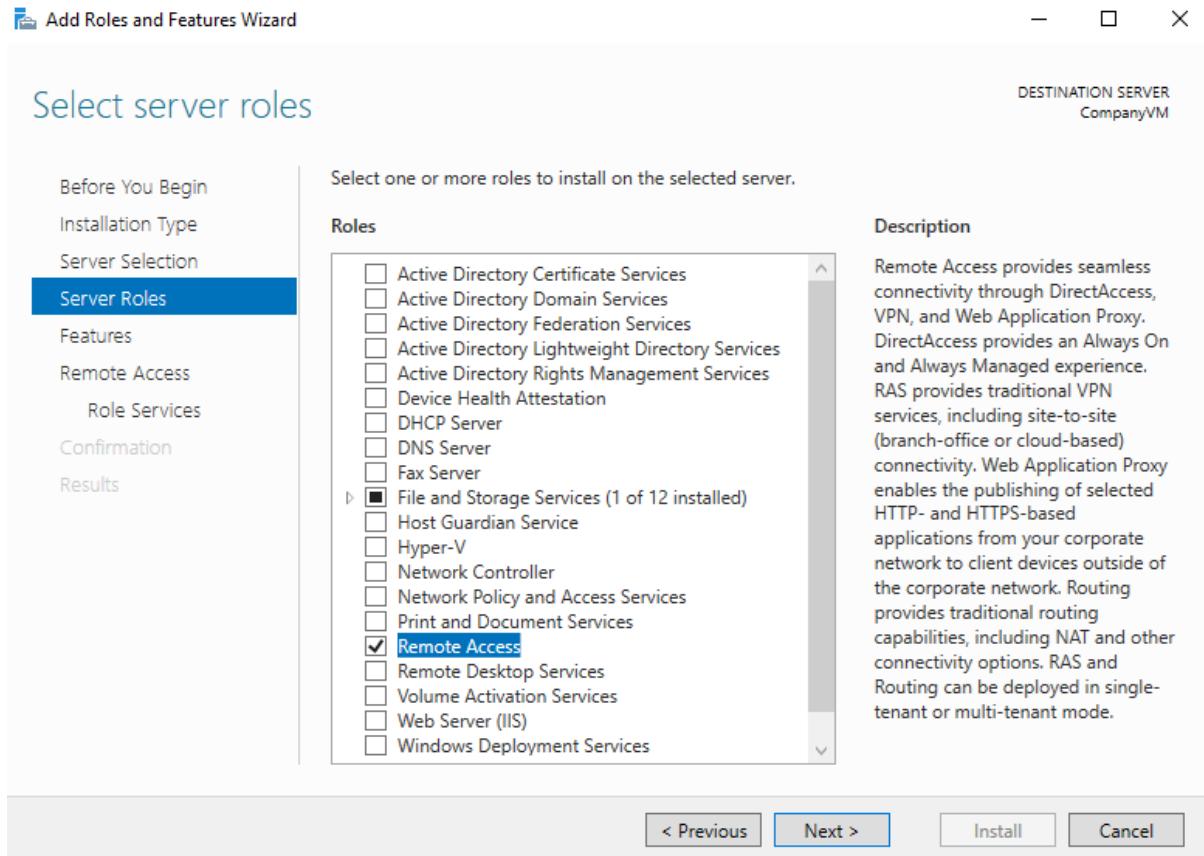

Public IP ⓘ

(new) CompanyVM-ip

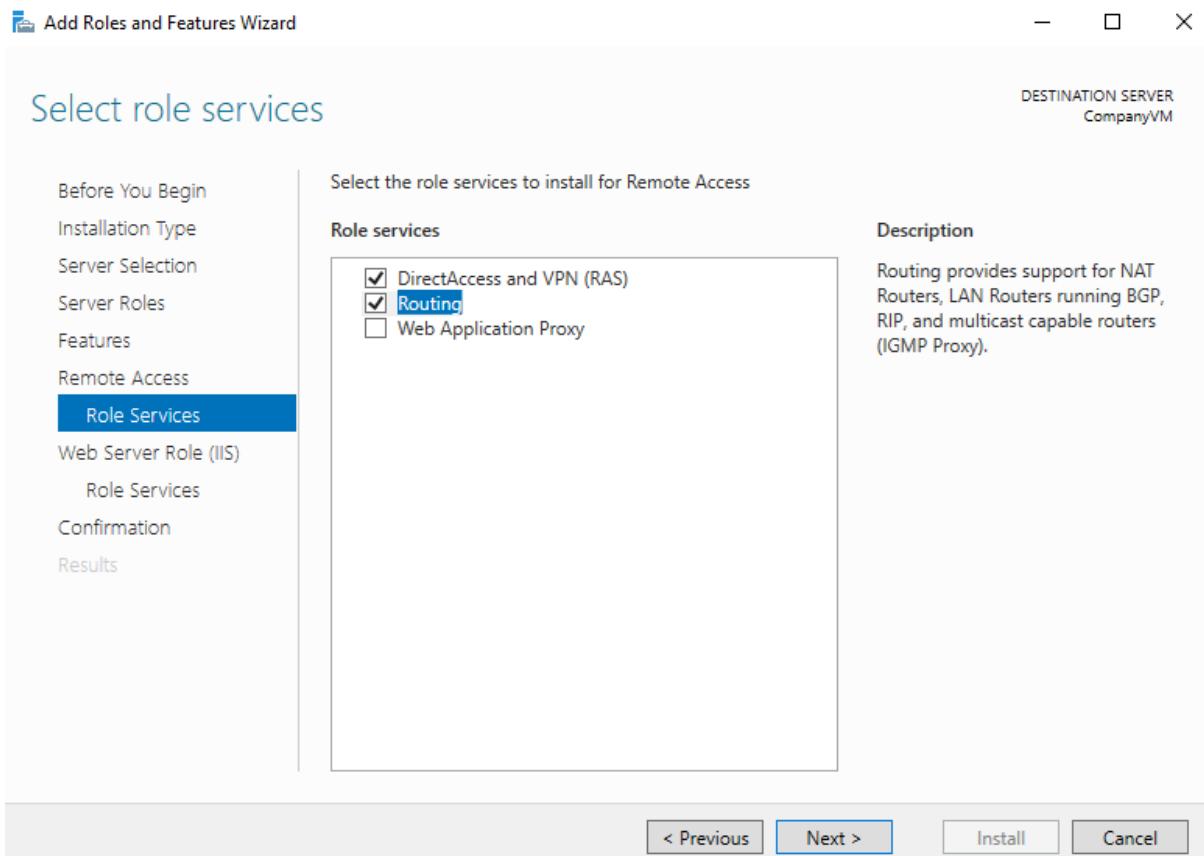

[Create new](#)

4. Then jump directly to the review page and create your VM. Once your VM is deployed, then login to it.
5. Now inside your VM you have to install remote access instead of the web server this time.

6. After that in role services you have to choose both of the services shown below.
7. Also we are installing these roles so that our VM will behave as a software router.

8. So, for this to work we also need to create a local gateway. For that in your Portal from the marketplace search for the local network gateway.

The screenshot shows the Azure Marketplace search results for 'Local network gateway'. It features a blue icon with three dots, the title 'Local network gateway' with a 'Microsoft | Azure Service' badge, a rating of '★ 4.0 (3 ratings)', and a 'Create' button. Below the title, there's a dropdown menu set to 'Local network gateway' and a 'Plan' section.

9. Then you need to choose your resource group, after that give it a name and in the IP address you have to put the Public IP address of your company VM and then in the address space put the address space of the company VM. You can get the address space of the company VM from its virtual network.

Basics Advanced Review + create

A local network gateway is a specific object that represents an on-premises location (the site) for routing purposes. [Learn more](#)

Add additional address range

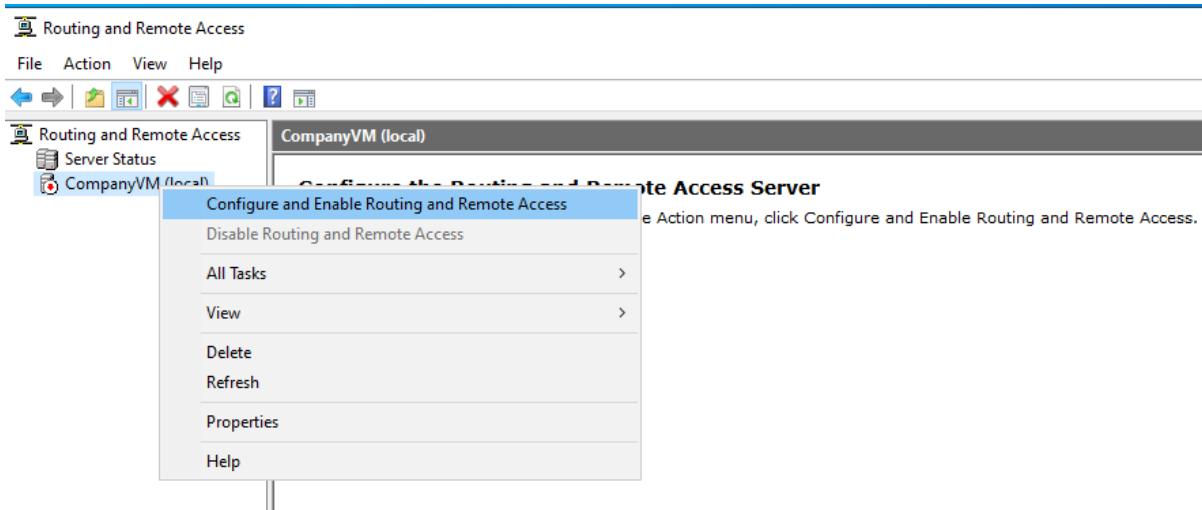

10. Once it is deployed, then you need to go back to your VM and you will see that the installation is also complete. You need to configure it now.

11. Then you have to choose deploy VPN only.

12. Now it will open up the wizard for routing and remote access, then choose company VM and right click on it then choose configure and enable.

13. Then you have to choose custom configuration and click on next.

## Routing and Remote Access Server Setup Wizard

### Configuration

You can enable any of the following combinations of services, or you can customize this server.

- Remote access (dial-up or VPN)  
Allow remote clients to connect to this server through either a dial-up connection or a secure virtual private network (VPN) Internet connection.
- Network address translation (NAT)  
Allow internal clients to connect to the Internet using one public IP address.
- Virtual private network (VPN) access and NAT  
Allow remote clients to connect to this server through the Internet and local clients to connect to the Internet using a single public IP address.
- Secure connection between two private networks  
Connect this network to a remote network, such as a branch office.
- Custom configuration  
Select any combination of the features available in Routing and Remote Access.

< Back

Next >

Cancel

14. After that you have to choose VPN access and LAN routing. Then just finish up the process then you will get the pop up to start the service click on it.

## Routing and Remote Access Server Setup Wizard

### Custom Configuration

When this wizard closes, you can configure the selected services in the Routing and Remote Access console.

Select the services that you want to enable on this server.

- VPN access
- Dial-up access
- Demand-dial connections ( used for branch office routing )
- NAT
- LAN routing

< Back

Next >

Cancel

15. After that you need to go to Virtual network gateway and go to connection then click on add.

The screenshot shows the Azure portal interface for a virtual network gateway named "demo-network-gateway". The left sidebar has a tree view with "Overview", "Activity log", "Access control (IAM)", "Tags", "Diagnose and solve problems", "Settings" (which is expanded to show "Configuration" and "Connections"), and "Connections" (which is selected and highlighted in grey). The main content area has a search bar "Search connections" and a table with one row "No results".

16. Then you need to choose your resource group and choose the connection type as shown below.

The screenshot shows the "Create Site-to-Site connection" wizard. Under "Project details", "Subscription" is set to "Azure Pass - Sponsorship" and "Resource group" is set to "new-grp". Under "Instance details", "Connection type" is set to "Site-to-site (IPsec)", "Name" is set to "siteconnection", and "Region" is set to "North Europe".

17. Now you need to choose your virtual network gateway and local network gateway. After that, you have to give the shared key, think of it like a password, and write down anything like abc123.

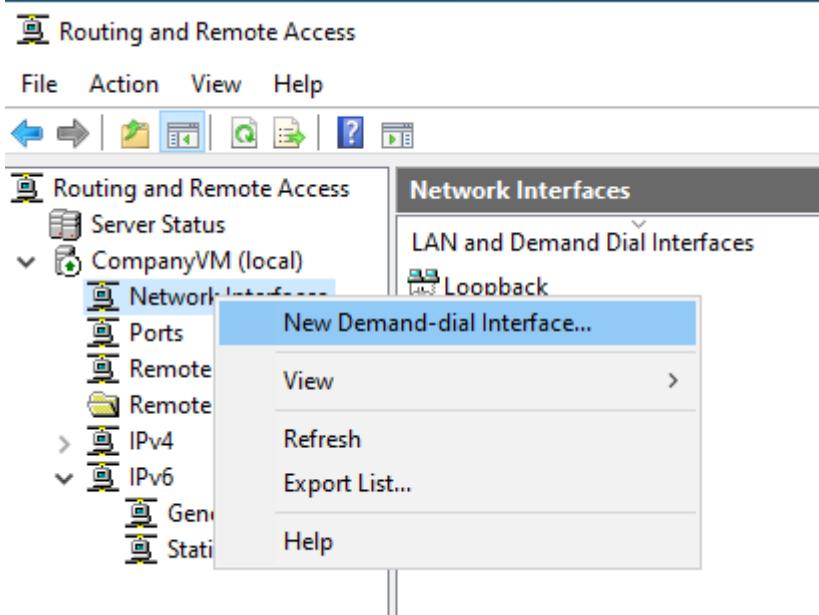

Basics    **Settings**    Tags    Review + create

### Virtual network gateway

To use a virtual network with a connection, it must be associated to a virtual network gateway.

Virtual network gateway *	<input type="text" value="demo-network-gateway"/>
Local network gateway *	<input type="text" value="localgateway"/>
Shared Key(PSK) *	<input type="password" value="....."/> <span style="color: green;">✓</span> <span style="color: blue;">👁</span>
IKE Protocol	<input type="radio"/> IKEv1 <input checked="" type="radio"/> IKEv2

18. After that just move to the review page and create it.
19. Now on our company VM we need to tell how to connect to our virtual network gateway.
20. Then go to the network interface right-click on it and choose the new demand-dial interface.

21. Now follow the snapshots to fill out the properties.

**Connection Type**

Select the type of demand-dial interface you want to create.

- Connect using a modem, ISDN adapter, or other device
- Connect using virtual private networking (VPN)
- Connect using PPP over Ethernet (PPPoE)

&lt; Back

## Demand-Dial Interface Wizard

X

**VPN Type**

Select the type of VPN connection you want to create.

- Automatic selection
- Point to Point Tunneling Protocol (PPTP)
- Layer 2 Tunneling Protocol (L2TP)
- IKEv2

&lt; Back

Next &gt;

Cancel

22. Here you need to write the IP address of your virtual network gateway.

## Demand-Dial Interface Wizard

X

### Destination Address

What is the name or address of the remote router?

Enter the name or IP address of the router you are connecting to.

Host name or IP address (such as microsoft.com or 157.54.0.1 or 3ffe:1234::1111):

4.209.241.243

< Back

Next >

Cancel

## Demand-Dial Interface Wizard

X

### Protocols and Security

Select transports and security options for this connection.

Select all that apply:

- Route IP packets on this interface.
- Add a user account so a remote router can dial in
- Send a plain-text password if that is the only way to connect
- Use scripting to complete the connection with the remote router

< Back

Next >

Cancel

23. Now you need to click on add and the static route.

## Demand-Dial Interface Wizard

X

### Static Routes for Remote Networks

A static route is a manually defined, permanent route between two networks.

To activate this demand-dial connection, you must add a static route to the network. Specify the IP address of the remote networks this network will communicate with.

Static Routes:

Destination	Network Mask/Prefix length	Metric

Add

Remove

< Back

Next >

Cancel

24. To add the static route, you need to go and see the address space of your demo VM because we want our traffic to route there. Then fill out the destination with a private IP address and the network is based /16.

## Demand-Dial Interface Wizard

Static Route

Remote Network Support using IPv4

Destination:

Network Mask:

Metric:

Remote Network Support using IPv6

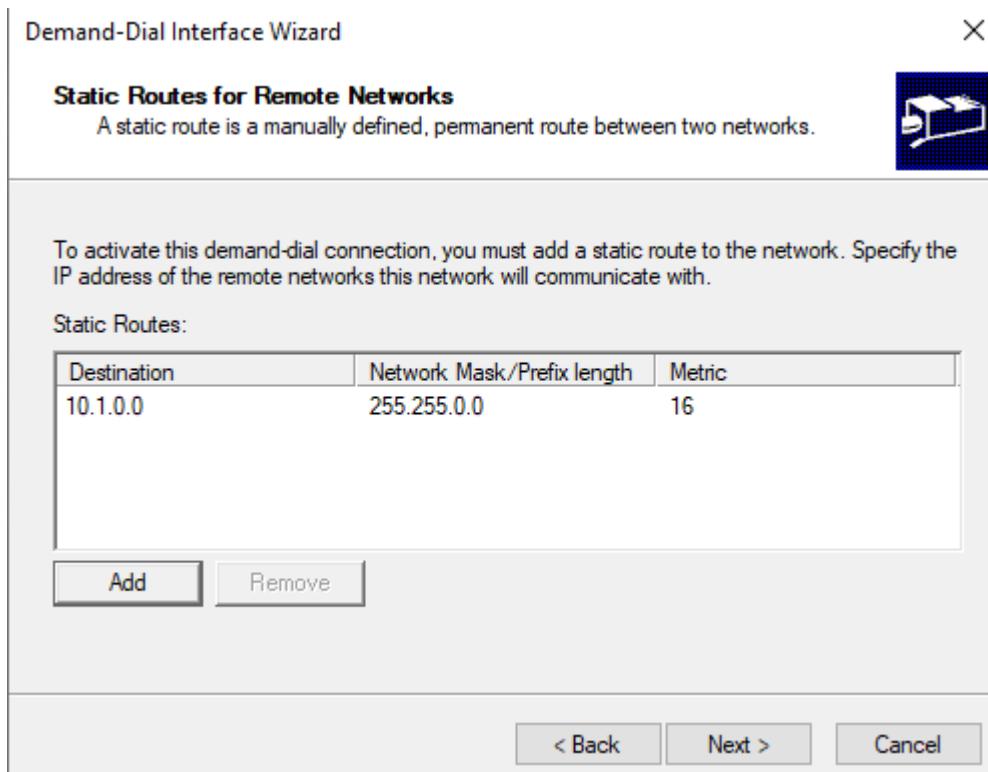

Destination:

Prefix Length:

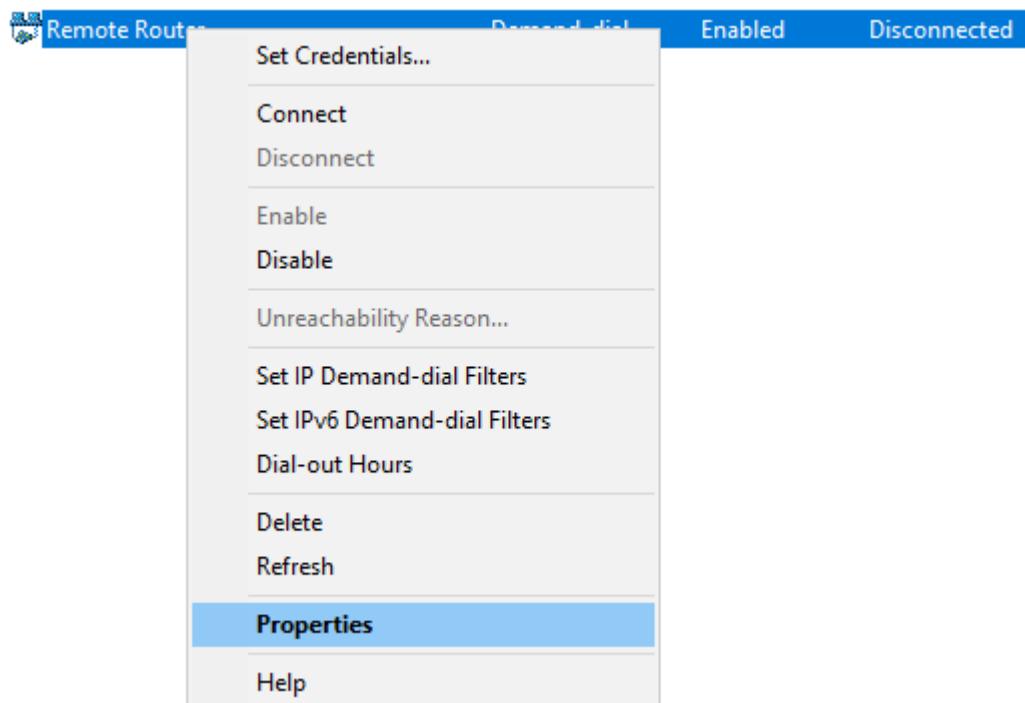

Metric:

OK Cancel

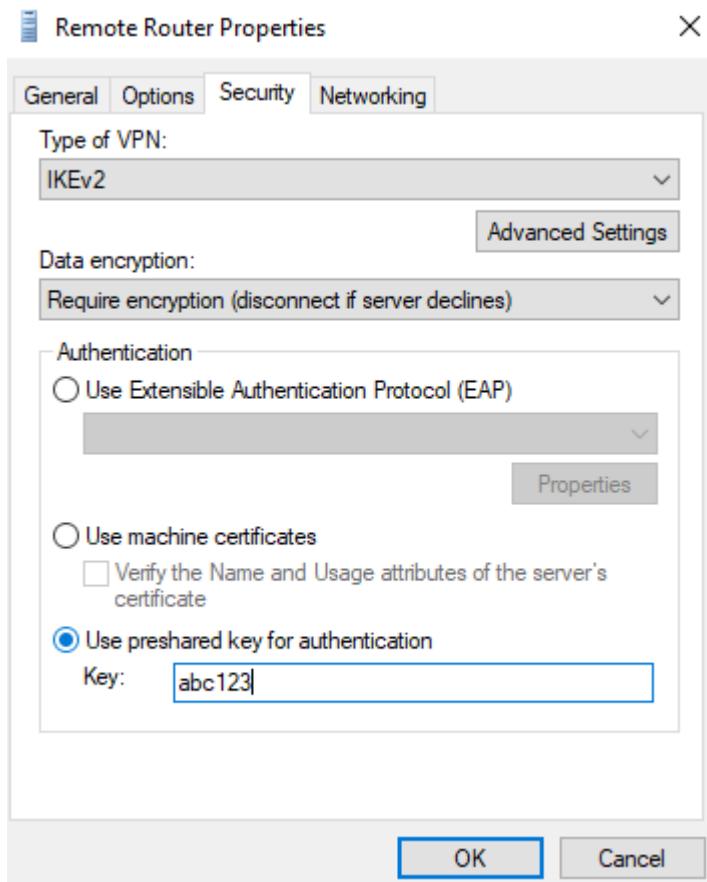

25. Below you can see that the static route has been added. After that just finish up the things.

26. Then you need to right click on the demand-dial interface and choose properties.

27. Now you need to go to security and enter that pre-shared key for authentication, which we had entered when creating the site-to-site connection for a virtual network gateway.

28. Now again right click on the remote router and click on connect.

29. Now you need to open the Edge browser and paste the Private IP address of your Demo VM and you will see the web page as expected from your company VM.
